PORTFOLIO ATTRIBUTION COMPARISON

Northstar Attribution Comparison (TEST)

Historical, ex ante and simulated lanes ? governed server comparison

PORTFOLIO
Northstar (TEST)

MODE
Three lane

ASSESSMENT
Three compatible lanes compared

EVIDENCE COMPLETENESS
4 of 4 · Complete

01 Executive Comparison

Two governed lanes are available without server comparison metrics

ASSESSMENT

Three compatible lanes compared

EVIDENCE COMPLETENESS · 4/4

BOTTOM LINE

Historical, ex ante, and simulated effects are compatible, and governed comparison metrics are available S2 S3 S4 S5.

HISTORICAL LANE	EX ANTE LANE	SIMULATED LANE	COMPARISON COVERAGE
Available	Available	Available	Complete
Realized effects S2	Expected effects S3	Governed scenario S4	Server comparison S5

Key judgment — Historical

Observation: Historical effects are returned S2. Why it matters: Realized sources can be described.
Uncertainty: One period may not persist. What would change the view: A later governed period.

Key judgment — Ex ante

Observation: Ex ante effects are returned S3. Why it matters: Expected sources can be described.
Uncertainty: Inputs are assumptions. What would change the view: Refreshed governed inputs.

Key judgment — Comparison

Observation: Comparison capability is unavailable S1. Why it matters: Persistence cannot be assessed.
Uncertainty: A future tool may return metrics. What would change the view: Published capability.

02 Scope and Compatibility

Portfolio, benchmark, cohort and currency identifiers match

Compatibility gate	**Available**	Four identifiers match S2 S3

03 Historical Attribution

Returned realized effects are shown without recalculation

HISTORICAL EFFECTS

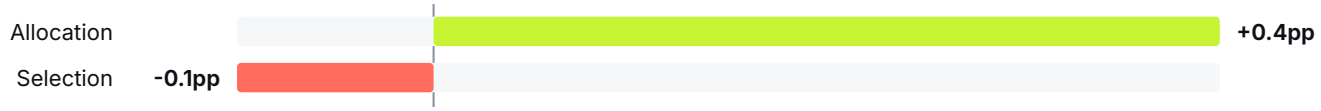

Analysis — Selection leads detractors

Observation: Returned selection is negative S2. Why it matters: Selection leads realized detractors. Uncertainty: The evidence covers one linked period. What would change the view: A later historical result.

04 Governed Ex Ante Attribution

Returned expected effects are shown as assumptions

EX ANTE EFFECTS

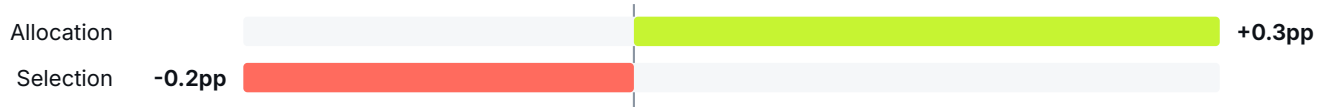

Analysis — Allocation leads expectations

Observation: Returned allocation is positive S3. Why it matters: Allocation leads expected effects. Uncertainty: Inputs are assumptions. What would change the view: A refreshed ex ante result.

05 Simulated Attribution

Governed simulation returns scenario effects

SIMULATED EFFECTS

Capability	**Available**	Capability-gated before invocation S1
Invocation	**Available**	Called only after exact availability S1 S4
Lane identity	**Available**	Portfolio, cohort, currency and basis preserved S4
Uncertainty	**Available**	Returned simulation method retained S4

Analysis — Scenario effects returned

Observation: Simulated allocation is positive S4. Why it matters: Scenario attribution is available. Uncertainty: Results depend on governed scenario inputs. What would change the view: A revised simulation result.

06 Cross-Lane Comparison

Governed comparison returns compatible cross-lane metrics

RETURNED LANE COMPARISON

Analysis — Lanes differ in sign

Observation: Returned lane signs differ S5. Why it matters: Realized and expected sources are not interchangeable. Uncertainty: Each lane uses a distinct governed basis. What would change the view: A refreshed comparison receipt.

07 Coverage and Limitations

Two live lanes and two capability gaps define coverage

Historical	**Available**	Governed result S2
Ex ante	**Available**	Governed result S3
Planned tools	**Available**	Capability-gated results S4 S5

08 Appendix A — Sources and Methods

Governed source inventory

TAG	EVIDENCE	TOOL
S1	Capability gate	get_gradient_capabilities
S2	Historical attribution	get_portfolio_attribution
S3	Ex ante attribution	get_portfolio_ex_ante_attribution

TAG	EVIDENCE	TOOL
S4	Simulated attribution	simulate_portfolio_attribution
S5	Cross-lane comparison	compare_portfolio_attribution

Method boundary

Each lane remains on its returned method, period or horizon, benchmark role, parent cohort and calculation currency. Historical evidence is realized, ex ante evidence is expected, and simulated evidence is scenario-based. Values are displayed without local reconciliation, attribution arithmetic or substitutions S1 S2 S3.

Comparison boundary

Cross-lane differences, concentration, overlap, reconciliation and persistence are reported only when the governed comparison capability returns them. Capability absence is an evidence limitation, not a zero value or a failed lane. Request IDs, diagnostics, residuals and coverage remain attached to their source payloads S1.
